

## Homework-8

### 1 What does DAX stand for?

DAX is the calculation language of Power BI.

### 2 What is the difference between a calculated column and a measure?

Calculated Column = creates *new data* in your model.

Measure = calculates *answers* in your report.

### 3 What does COUNTROWS() do in DAX?

COUNTROWS() doesn't count values like COUNT() does — instead, it counts **rows**.

### 4 What is a circular dependency error in a calculated column?

Circular Dependency Error (in a calculated column)

A circular dependency error happens when a calculated column's formula depends on itself, directly or indirectly.
